12
13 ReactDOM.render(
14   <Provider store={store}>
15     <Router history={history}>
```

Vscode typescript auto format on save.

A better option for global defaults is to put a `~/.prettierrc` file in your home directory. It is recommended that you always include a prettier configuration file in your project specifying all settings for your project. Files which match will not be formatted. If you don't like the defaults, you can rebind `editor.action.formatDocument` and `editor.action.formatSelection` in the keyboard shortcuts menu of vscode. This workspace is not trusted. See the documentation for how to do that. Settings can also be configured through VS Code - however, these settings will only apply while running the extension, not when running prettier through the command line. No plugins, local, or global modules will be supported. { "overrides": [{ "files": "**.abc", "options": { "parser": "babel" } }] } Disabled on untrusted workspaces prettier.useEditorConfig (default: true) Whether or not to take .editorconfig into account when parsing configuration. Settings will be read from (listed by priority): NOTE: If any local configuration file is present (i.e. .prettierrc) the VS Code settings will NOT be used. Upgrade to the latest version of prettier. This setting can be set for all languages or by a specific language. NOTE: This setting can have a negative performance impact, particularly on Windows when you have attached network drives. { "javascript": { "editor.formatOnSave": false } } Prettier Resolution This extension will use prettier from your project's local dependencies (recommended). Prettier is an opinionated code formatter. You can find instructions on how to configure each linter on the Prettier docs site. This feature can be useful when you have overrides set in your config file to map custom extensions to a parser. Using the bundled version of prettier. Installation Install through VS Code extensions. These settings are used as a fallback when no configuration file is present in your project, see the configuration section of this document for more details. To install prettier in your project and pin its version as recommended, run: `npm install prettier -D --save-exact` NOTE: You will be prompted to confirm that you want the extension to load a Prettier module. It enforces a consistent style by parsing your code and re-printing it with its own rules that take the maximum line length into account, wrapping code when necessary. Options are searched recursively down from the file being formatted so if you want to apply prettier settings to your entire project simply set a configuration in the root. Set to null to not read ignore files. Only enable this if you must use global modules. You can learn about these for each platform in the VS Code documentation. The following languages currently are supported: javascript javascriptreact typescript typescriptreact json graphql handlebars Format Document (Forced) If you would like to format a document that is configured to be ignored by Prettier either because it is in a .prettierrc file or part of a normally excluded location like node_modules, you can run the command `Format Document (Forced)` to force the document to be formatted. This path should be to the module folder, not the bin/script path. { "editor.defaultFormatter": "", "javascript": { "editor.defaultFormatter": "esbenp.prettier-vscode" } } Additionally, you can disable format on save for specific languages if you don't want them to be automatically formatted. Note: Disabling a language enabled in a parent folder will prevent formatting instead of letting any other formatter to run Disabled on untrusted workspaces prettier.documentSelectors A list of glob patterns to register Prettier formatter. See: Workspace Trust ext install esbenp.prettier-vscode Default Formatter To ensure that this extension is used over other extensions you may have installed, be sure to set it as the default formatter in your VS Code settings. Untitled files will still be formatted using the VS Code Prettier configuration even with this option set to true. For example, if I register the following document selector by itself, Prettier still won't know what to do with that file. Note, if this is set, this value will always be used and local configuration files will be ignored. Disabled on untrusted workspaces prettier.resolveGlobalModules (default: false) When enabled, this extension will attempt to use global npm or yarn modules if local modules cannot be resolved. JavaScript · TypeScript · Flow · JSX · JSON CSS · SCSS · Less HTML · Vue · Angular HANDLEBARS · Ember · Glimmer GraphQL · Markdown · YAML Your favorite language? Using Prettier Configuration files to set formatting options is the recommended approach. In order to use defaults from earlier versions of prettier you must set them manually using your VS Code settings or local project configurations. When the prettier.resolveGlobalModules is set to true the extension can also attempt to resolve global modules. Format On Save Respects editor.formatOnSave setting. Workspace Trust This extension utilizes VS Code Workspace Trust features. prettier.arrowParens prettier.bracketSpacing prettier.endOfLine prettier.htmlWhitespaceSensitivity prettier.insertPragma prettier.jsxBracketSameLine prettier.jsxSingleQuote prettier.printWidth prettier.proseWrap prettier.quoteProps prettier.requirePragma prettier.semi prettier.singleQuote prettier.tabWidth prettier.trailingComma prettier.useTabs prettier.vueIndentScriptAndStyle prettier.embeddedLanguageFormatting Extension Settings These settings are specific to VS Code and need to be set in the VS Code settings file. prettier.enable (default: true) Controls whether prettier is enabled or not. Disabled on untrusted workspaces prettier.prettierPath Supply a custom path to the prettier module. You must trust this workspace to use plugins and local/global modules. However, be careful, if this is set this value will always be used and local configuration files will be ignored. Visual Studio Code Settings You can use VS Code settings to configure prettier. I either need a Prettier extension that formats .abc file format or I need to configure Prettier. Search for Prettier - Code formatter Visual Studio Code Market Place: Prettier - Code formatter Can also be installed in VS Code: Launch VS Code Quick Open (Ctrl+P), paste the following command, and press enter. Disabled on untrusted workspaces Error Messages Failed to load module. Configuring Default Options Some users may not wish to create a new Prettier config for every project or use the VS Code settings. { "editor.defaultFormatter": "esbenp.prettier-vscode", "javascript": { "editor.defaultFormatter": "esbenp.prettier-vscode" } } If you want to disable Prettier on a particular language you can either create a .prettierrc file or you can use VS Code's editor.defaultFormatter settings. Typically these will be in the format of `**/*.abc` to tell this extension to register itself as the formatter for all files with the abc extension. It is likely will need to also update your prettier config. You can then use each of the linting extensions as you normally would. { "prettier.documentSelectors": ["**/*.abc"] } To tell Prettier how to format a file of type .abc I can set an override in the prettier config that makes this file type use the babel parser. Usage Using Command Palette (CMD/CTRL + Shift + P) 1. It is recommended that you always use local modules when possible. If you have Prettier and a plugin registered in your package.json, this extension will attempt to register the language and provide automatic code formatting for the built-in and plugin languages. This will ensure that no matter how you run prettier - from this extension, from the CLI, or from another IDE with Prettier, the same settings will get applied. For details refer to the Prettier documentation. Disabled on untrusted workspaces (always false) prettier.withNodeModules (default: false) Whether or not to process files in the node_modules folder. This is done to ensure that you are not loading a module or script that is not trusted. You can turn on format-on-save on a per-language basis by scoping the setting: // Set the default "editor.formatOnSave": false, // Enable per-language "javascript": { "editor.formatOnSave": true } Format Selection Format selection works on several languages depending on what Prettier itself supports. Disabled on untrusted workspaces prettier.configPath Supply a custom path to the prettier configuration file. Linter Integration The recommended way of integrating with linters is to let Prettier do the formatting and configure the linter to not deal with formatting rules. See the prettier.resolveConfig docs for details. You can use VS Code settings, prettier configuration files, or an .editorconfig file, i.e. `./node_modules/prettier`, not `./bin/prettier`. Plugins This extension supports Prettier plugins when you are using a locally or globally resolved version of prettier. `CMD + Shift + P -> Format Selection Keyboard Shortcuts` Visual Studio Code provides default keyboard shortcuts for code formatting. Configuration There are multiple options for configuring Prettier with this extension. Settings Prettier Settings All prettier options can be configured directly in this extension. The VS Code settings are meant to be used as a fallback and are generally intended only for use on non-project files. If you see this error, it most likely means you need to run `npm install` or `yarn install` to install the packages in your package.json. You must upgrade to a newer version of prettier. Select the text you want to Prettify 2. Forced mode will also ignore any config for `requirePragma` allowing you to format files without the pragma comment present. Should prettier not be installed locally with your project's dependencies or globally on the machine, the version of prettier that is bundled with the extension will be used. You must restart VS Code when you change this setting. Additionally, certain settings are also restricted - see each setting for details. Note, if this is set, this value will always be used and local ignore files will be ignored. prettier.requireConfig (default: false) Require a prettier configuration file to format files. { "editor.defaultFormatter": "esbenp.prettier-vscode", "javascript": { "editor.defaultFormatter": "" } } The following will use Prettier for only javascript. In order to set a default configuration, set prettier.configPath. For reference on the options see the prettier documentation. prettier.ignorePath (default: .prettierrc) Supply the path to an ignore file such as .gitignore or .prettierrc. If you have prettier or plugins referenced in package.json, ensure you have run `npm install` When a package.json is present in your project and it contains prettier, plugins, or linter libraries this extension will attempt to load these modules from your node_modules folder. The following will use Prettier for all languages except javascript. The default values of these configurations are always to their Prettier 2.0 defaults. `CMD + Shift + P -> Format Document OR 1`. Your project is configured to use an outdated version of prettier that cannot be used by this extension. When this extension is run on an untrusted workspace, it will only use the built in version of prettier.
